Step 1 - Take out the brush from the packet, then gently scrape one corner with your fingernail to lift the thin plastic or paper film from the double-sided (teaser) tape stuck on the top of the brush.

Step 3 - Sticks blue wire on the tape and place the battery over it.

Step 2 - Stick the vibration motor to the rear end of the brush on the double-sided (teaser) tape.

Step 4 - Stick the googly eyes with fevistick on both sides of the brush. Stick the red wire to the battery positive terminal with cello tape. This will complete the circuit and the motor will vibrate and the bristles will make the robot wiggle.
